

PREDICTION OF HEART DISEASES USING RANDOM FOREST

AAKASH SINGH (2100290109001)

LALIT KISHOR (2200290109008)

SUHEL KHAN (2200290109016)

SUPERVISION :

PROF. GAURAV PARASHAR

The background of the slide is a gradient of blue, transitioning from a lighter shade at the top to a darker shade at the bottom. Overlaid on this background are white, stylized circuit lines. These lines are composed of straight segments and right-angle turns, with small circles at various points, resembling a printed circuit board (PCB) layout. The lines are primarily located along the left and right edges of the slide, with some extending towards the center.

INTRODUCTION

- Heart disease is a leading global cause of mortality.
- Early detection is vital for effective treatment.
- Machine Learning (ML) helps identify patterns for better diagnosis.

PROBLEM STATEMENT

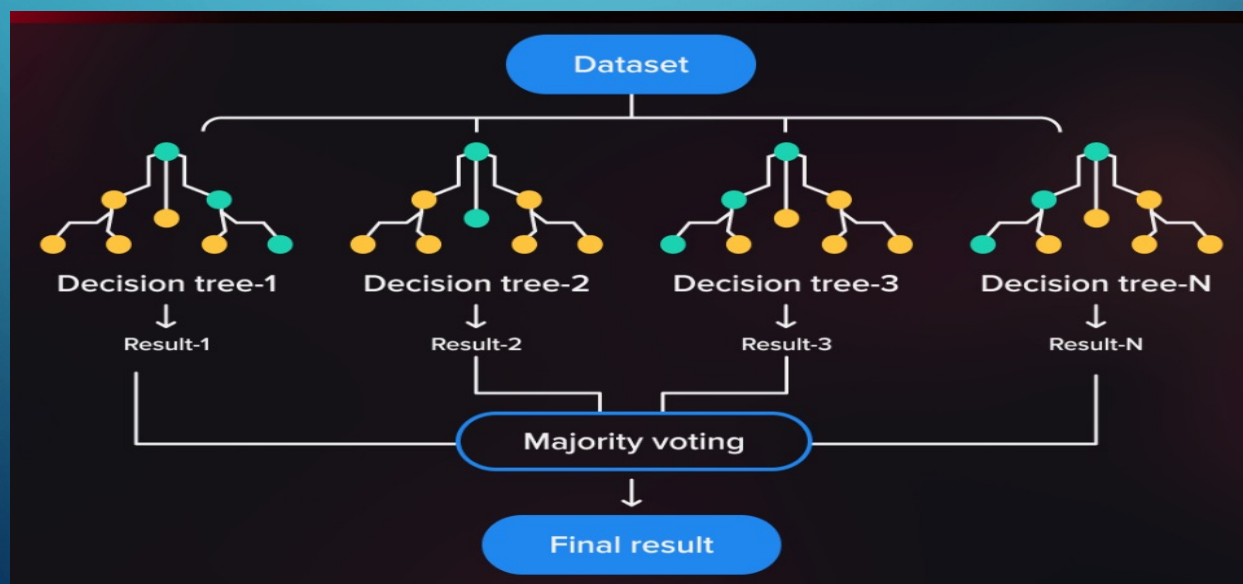

- Traditional diagnostic methods may miss patterns in data.
- Need for a reliable, automated model for heart disease prediction.
- Aim: Build an accurate ML model for early detection.

DATASET OVERVIEW

- Used dataset with 303 records and 14 clinical features.
- Includes: age, sex, chest pain type, cholesterol, etc.
- Sourced from trusted medical databases (e.g., Kaggle).

RANDOM FOREST ALGORITHM

- Ensemble learning model combining decision trees.
- Reduces overfitting and increases prediction accuracy.
- Performs well with both categorical and numerical data.

DATA PREPROCESSING

- Handled missing values using imputation.
- Normalized data for consistency.
- Used feature selection methods like PCA.

PERFORMANCE METRICS

- Accuracy: 89.92%
- Sensitivity: 91.58%, Specificity: 87.67%
- AUC: 94.16% - strong discrimination ability.

COMPARATIVE ANALYSIS

- Random Forest outperformed Logistic Regression, SVM, Naive Bayes.
- Best overall balance of accuracy and interpretability.
- SVM showed highest accuracy (94.41%) but less interpretability.

IMPLEMENTATION

- Frontend: HTML, CSS, JavaScript.
- Backend: Python and Jupyter Notebook.
- Integrated model to website for real-time prediction.

CONCLUSION

Random Forest model
effectively predicts
heart disease.

High accuracy and
robust against noise.

User-friendly web
interface enhances
accessibility.

FUTURE SCOPE

1

Integrate real-time health data from wearables.

2

Use larger, diverse datasets for broader generalization.

3

Expand model for other chronic disease predictions.
